

Login Authentication System (Frontend Only)

Overview

This project demonstrates a simple Login Authentication System built using frontend technologies such as HTML, CSS, and JavaScript.

It includes features like user login, input validation, and basic credential checking (simulated locally or using browser storage).

Features

 User-friendly login interface

 Password masking for security

 Input validation for email and password

 Option to store credentials using localStorage (optional)

 Responsive design for all screen sizes

Technologies Used

Technology	Purpose
------------	---------

HTML5	Structure of the web page
-------	---------------------------

CSS3	Styling and layout
------	--------------------

JavaScript (ES6)	Logic for validation and authentication
------------------	---

(Optional) Bootstrap / Tailwind CSS	For faster UI design
-------------------------------------	----------------------
